Voice To Text For Mac Os

There is basic dictation software built into OS X, and there is a program developed by Nuance called Dragon Dictate for Mac.. All dictation-capable text-to-speech products work very well for some people and fairly badly for others.. Dictate is the successor to a program named iListen which MacSpeech used to produce.. They are not available for download for other operating systems, but may have similar sounding voices elsewhere.. Note: These voices are property of Apple Computer, and are part of the Macintosh Operating System (Mac OS) for Apple Macintosh computers.. Converting text to speech is very full-featured, but the built-in speech recognition system is much more limited.. Macintosh OS X has speech functions built into the operating system, found in the Speech pane of System Preferences.

The Mac has a text to speech feature, where the Mac reads selected text In this how-to, you will learn how to change the system voice, as well as add new voices.
